Diagnostic Recommendation

- 1、【Colorless or light yellow】 It is common to dilute urine.
- 2、【BAC#>0】 It is suspected that there are many interference factors in bacterial detection (such as amorphous crystallization, etc.). This result is for reference only, and it is recommended to confirm bacterial culture.
- 3、【GRA#>0】 It is common in accelerated renal tubular degeneration and glomerular disease.
- 4、【FAT#>160】 It can be seen in the urine of normal cats and is often caused by obesity, cystitis, hypothyroidism, diabetes or artificial catheterization.
