### Clinical Significance

#### Individual Diagnosis

1. [Formed stool] Fecal consistency is within normal physiological range.
2. [CEE#>0] Indicates the pet may be infected with tapeworms.
3. [SPI#>0] Indicates the pet may be infected with Taenia tapeworms.
4. [TRI#>0] Indicates the pet may be infected with Giardia.
5. [COD#>0] Indicates the pet may be infected with spherical viruses or virus-like particles.
6. [COD0#>0] Indicates the pet may be infected with spherical viruses or virus-like particles.
7. [C/B>0.15] Commonly seen in cases of intestinal dysbiosis caused by illness or antibiotic use disrupting gut flora balance.
8. [AF#>0.10] Common when pets consume large amounts of meat, have indigestion, increased intestinal motility, diarrhea, or decreased exocrine pancreatic function and trypsin secretion.

#### Combined Diagnosis

1. [COS#<145BACI#<510] Indicates sparse intestinal microbiota structure, commonly seen in cases of severe watery diarrhea or post-antibiotic treatment. Clinical diagnosis should be combined with the pet's symptoms.
2. [TRI#<6TRI#>0] Suspected Trichomonas infection with low detected quantity. Manual microscopic examination is recommended for confirmation.
