

PHÒNG KHÁM THÚ Y SUNVET

Test Report of Feces Morphological Analysis

Pet Name: Com
Gender: Female
Case No.:

Owner Tel.:
Species: Feline
Test Time: 2025-10-26 11:11

Owner Name:
Age:

Texture: Soft stool

Color: Tan

Test Results

Test Item		Test Result	Reference Range	Negative	Positive
01 Parasite eggs	ALE#	0.0	0.00-0.00 /LPF	-

Concentration: 0.94 /HPF

RBC

—15µm—

Concentration: 0.02 /HPF

AF

—40µm—

Concentration: 0.8 /HPF

Clinical Significance

Individual Diagnosis

1. [Tan] Fecal color appears normal.
2. [Soft stool] Common when excessive mucus is produced by the intestinal lining, with increased motility, infection/inflammation, or food intolerance.
3. [TRI#>0] Indicates the pet may be infected with Giardia.
4. [C/B>0.15] Commonly seen in cases of intestinal dysbiosis caused by illness or antibiotic use disrupting gut flora balance.
5. [AF#>0.10] Common when pets consume large amounts of meat, have indigestion, increased intestinal motility, diarrhea, or decreased exocrine pancreatic function and trypsin secretion.

Combined Diagnosis

1. [COS#<145BACI#<510] Indicates sparse intestinal microbiota structure, commonly seen in cases of severe watery diarrhea or post-antibiotic treatment. Clinical diagnosis should be combined with the pet's symptoms.
2. [TRI#<6TRI#>0] Suspected Trichomonas infection with low detected quantity. Manual microscopic examination is recommended for confirmation.
