Diagnostic Recommendation

Single diagnosis:

I. [RBC>12.60] It is common in diseases related to dehydration, compensatory or pathological increase of erythropoietin, adrenocortical hyperfunction, true polycythemia and so on.

1. [HCT>47.00] It is common in dehydration, use of catecholamines, compensatory or pathological increase of erythropoietin, adrenocortical hyperfunction, hyperthyroidism, limb hypertrophy and so on.

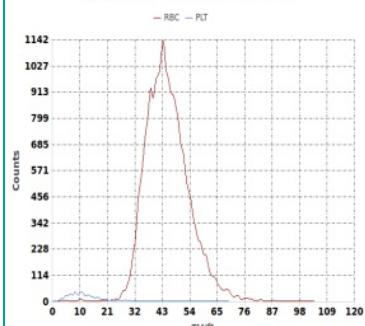

2. [NRBC/WBC%>0.00%] It is common in heatstroke, splenic contraction, post-splenectomy, hyperthyroidism, Cushing's syndrome, corticosteroid use, myeloproliferative disorders, sepsis, endotoxic shock, drug-induced bone marrow suppression, others.

II. [PLT]

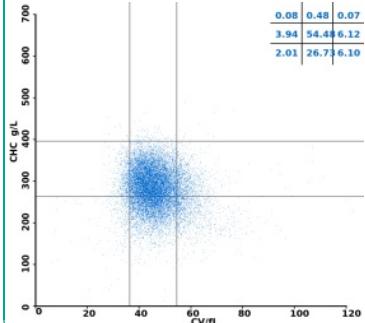

1. [APLT#>0.15] It is common in samples where micro-agglutination is not visible to the naked eye.

Causes of sample agglutination: Sample agglutinations: ①Physiological platelet agglutination; ②Poor anticoagulation after sampling; ③Prolonged storage; in pathological conditions is common in below situations: such as immune-mediated thrombocytopenia, azotemia, infectious diseases, malignant tumours, heart disease, drug-induced disorders. Suggestions for next step testing: Investigate sample processing and human interference factors; If no abnormalities are confirmed in sample testing, proceed with differential diagnosis based on pathology.
